# STAYING HEALTHY *For Baby*

- ☼ Poor oral health **can increase** the risk of spreading **bacteria** from the mother to her baby.
- ☼ **One in four** pregnant women has decayed teeth or gum disease.<sup>1</sup>

*RenaissanceFamily.com*

Pregnancy is an exciting time, and expectant mothers have to focus on what is best for them and a healthy baby. Exercise, a diet full of vitamins and nutrients, and plenty of doctor appointments take priority. But what about dental care?

With typical hormone changes during pregnancy, expectant mothers may notice a change in their oral health. Although periodontal (gum) disease affects 40 percent of all pregnant women,<sup>1</sup> more than half of women do not visit the dentist while pregnant and only half of those who experience oral health problems receive appropriate and timely care.<sup>2</sup> By delaying necessary dental treatment, expectant mothers may put themselves and their baby at risk. In fact, high maternal levels of the bacteria that causes cavities may contribute to low infant birth weight.<sup>3</sup>

Dental care during pregnancy is 100 percent safe—including the use of radiographs, pain medication and local anesthesia.<sup>4</sup> Don't let your oral health suffer during pregnancy—schedule an appointment with your dental team today.

## Quick Bites

### caring for your teeth during pregnancy

- Schedule at least one dental visit during pregnancy. Let your dental team know you are pregnant, and provide your due date. This ensures you receive the most-comfortable care.
- If you suffer from morning sickness, rinse your mouth with a teaspoon of baking soda in a cup of water to stop acid from attacking your teeth.
- Eat a nutritional diet with fewer foods high in sugar; avoid juice, fruit-flavored drinks or soda pop.
- After eating, chew xylitol-containing gum or similar products, like mints, to help reduce bacteria that can cause tooth decay.
